LC OL - Coordinate Geometry of The Line

## Slope of a line

- A line going up from left to right has a positive slope:

- A line going down from left to right has a negative slope:

- A line going flat from left to right has a slope of zero.

Note: The greater the number the greater the slope. For example a line with a slope of 7 is steeper than a line with a slope of 5 . A line with a slope of -7 would be steeper than a line with a slope of -5 (both negative so both downhill).

There are 4 ways to find the slope of a line:

## Method 1

$$
\text { slope }=\frac{r i s e}{r u n}
$$

## Eg1:

Eg2:

Notice that the slope is negative because it is going downhill!

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Method 2

$$

$$

4. What is the slope of the line with equation $5 x+4 y-7=0$

5. $L$ is the line $2 x-y+6=0$. Find the slope of $L$.

## LC OL - Coordinate Geometry of The Line

| Line 1 | $y=3 x-6$ |
| :--- | :--- |
| Line 2 | $y=3 x+12$ |
| Line 3 | $y=5 x+20$ |
| Line 4 | $y=x-7$ |

## Slopes of perpendicular lines

To find the slope of a perpendicular line you turn the slope upside down and change the sign

\begin{aligned}
& \text { eg1. } \frac{5}{3} \rightarrow-\frac{3}{5} \\
& \text { eg2. } 7 \rightarrow-\frac{1}{7}
\end{aligned}
$$

## Axial symmetry

Axial symmetry is like a mirror that is a line.
There are 3 types of symmetry here:

1. Axial symmetry in the x-axis, $S_{x}$

When we are asked to do this for a point we change the sign in front of the y part of the point.
2. Axial symmetry in the y-axis, $S_{y}$

When we are asked to do this we change the sign in front of the $x$ part of the point.
3. This method can also be used for central symmetry in the origin, $S_{o}$

When are asked to do this we change the signs infront of both parts of the point.

1. Find the image of $(4,3)$ under: (i) $S_{x}$ (ii) $S_{y}$ (iii) $S_{o}$

## The area of a triangle

$$
\text { area of triangle }=\frac{1}{2}\left|x_{1} y_{2}-x_{2} y_{1}\right|
$$

To use this formula we must move one vertex of the triangle to $(0,0)$ and translate the other two points.

1. Find the area of the triangle created by the points $a(1,-2), b(3,5)$ and $c(-2,2)$.
